OTT TITANS · RIDDLE VAULT

100 WOLVES, ONE SHEEP

DOES THE SHEEP SURVIVE?

THE CASE IN ONE LINE
A hundred perfect logicians circle one sheep — and every one of them is hungry.

CASE 01 · ONE RIDDLE · ONE ANSWER · NO SHORTCUTS

THE CASE

A sheep stands in a clearing. Around it, in a perfect ring, stand one hundred wolves.

The rules of the ring are strange. Any wolf may pounce and eat the sheep. But the instant a wolf eats, that wolf turns into a sheep itself — and the ring closes around the new sheep.

Every wolf wants the meal. But every wolf wants to live even more, and every wolf reasons perfectly — and knows the others reason perfectly too. Nobody is reckless. Nobody is kind. They are all simply, flawlessly logical.

THE QUESTION

Does the sheep get eaten — or does it walk away untouched?

THREE HINTS

Open them one at a time. Stop the moment you have it — the last hint nearly gives it away.

HINT 1
Start tiny. Forget the hundred — what happens with just one wolf? Then two?

HINT 2
Watch the pattern as the count climbs: three wolves behave differently from two, and four differently from three.

HINT 3
Work backwards from the end of the chain. The first wolf can predict every step that follows its bite — including its own fate.

YOUR MOVE

Does the sheep get eaten — or does it walk away untouched?

Decide your answer now — say it out loud or write it in the comments — before you turn this page. No going back.

THE REVEAL

THE ANSWER

The sheep survives. Not one wolf dares to move.

Work backwards. With 1 wolf, it eats safely — there is nobody left to eat it. With 2 wolves, if one eats, the other will eat it in turn, so neither eats: the sheep is safe.

With 3 wolves, a wolf that eats becomes a sheep facing 2 wolves — and the 2-wolf case is safe for the sheep, meaning safe for the eater. So with 3, a wolf does eat. The pattern alternates: odd counts eat, even counts hold.

100 is even. The first wolf knows that eating leaves 99 wolves facing it — an odd count, the eating case — and it would be eaten. Every wolf can run the same chain. Nobody moves.

WHY IT WORKS

This is backward induction: solve the smallest case, then let each bigger case inherit the answer from the one below it. The alternation — odd eats, even waits — is the whole machine.

Notice that no wolf needs courage or mercy. Pure self-interest, pushed through perfect logic, produces a standoff. That is why this riddle spreads: the answer feels impossible until the chain is shown, and then it feels inevitable.

THE TRAP, NAMED

The brain wants to simulate a hundred wolves at once and drowns. The fix is to shrink the problem until it is trivial — then climb.

MAKE THE VIDEO

This book is a production pack. The route from page to posted video:

1 · OPEN THE BOOK
The story, the question and the reveal in this book are your script beats, in order.

2 · GIVE IT TO THE AGENT
Paste the case into your AI agent (run it on Google Antigravity) and let it plan the shots from the beats.

3 · CONNECT GOOGLE FLOW
The agent builds the scenes as short clips in Flow. Keep the question on screen until the final seconds — the reveal is the last beat, never the first.

4 · EDIT + POST
Post with the question as the caption's first line and pin a comment asking for answers BEFORE the reveal. The debate in the comments is the engine.

ABOUT THIS BOOK

RIDDLE VAULT is the OTT Titans series of one-riddle books: one case per book, a verified answer, and the production route to turn it into a video. Every answer in this series is solved and checked before the book is made — if the logic has a hole, the riddle does not ship.

OWNERSHIP

This book — its text, structure and design — is owned by OTT TITANS. Reading or downloading it grants you the right to enjoy it and to produce your own version of the riddle video on your own channels. It never transfers ownership of the book.

More cases are waiting in the Vault — and a new riddle video lands every day on the 1 Minute Detective channels.
